Children know no boundaries. They are open to experiencing life in a fresh through a never-ending combination of sights and feelings that are often surprising and fascinating and that our own minds cannot begin to comprehend. (Exodus 3:3)

Children love to explore their environments. It is through this natural curiosity that our children learn about the world around them. They learn through their senses, noticing colors, sounds, smells, and textures. They learn through play, interacting with toys and games that stimulate their minds and imaginations.

The trick is to get parents to understand that our children's learning stages, early development, and how they learn to walk, talk, and read are just as important as our own. As parents, we need to understand that our children's learning process is unique and that we cannot force them to learn in a way that is not natural for them.

One day, the toys and we are in our toys room. I asked the children what their favorite toy was. It is not unusual for us to ask this question, but I was surprised when one child answered, "I don't have a favorite toy." When I asked why, he replied, "I like them all the same." I was amazed by his answer and thought it was very insightful.

One in a thousand babies is born with an understanding of cause and effect. The same child who cannot understand why a toy breaks is capable of understanding why a toy breaks. (Exodus 1:23)

As parents, we need to understand that our children's learning processes are unique and that we cannot force them to learn in a way that is not natural for them. The key is to understand that our children's learning processes are unique and that we cannot force them to learn in a way that is not natural for them.
